Senior Frontend Developer

01 LETTER

I'm applying for the Senior Frontend Developer role on Tempo's team. What stands out about the posting is that one line — wanting someone who solves customers' problems rather than just closes issues in the task tracker. That's the distinction I actually care about day to day, and building for a product used by a third of the Fortune 500 inside the Jira ecosystem is exactly the kind of scale where that distinction matters. I've also worked remote-first and autonomously for most of the past three years, comfortable starting on a problem before it's fully spec'd out.

The core of this role — writing maintainable TypeScript/React for complex, data-heavy UI — is what I've been doing for **8+ years**. At **Yield Guild Games** I built the **token system** end to end: market-data integrations, live price charts, transaction flows, all in a Next.js/TypeScript monorepo. Earlier at **SupaPass** I owned the CMS and led a full refactor of the legacy **Website Builder** (React, TypeScript, Next.js, GraphQL) used by thousands of creators, modernizing its UI/UX end to end. Both are the same shape of problem this role describes — genuinely complex interfaces, not CRUD forms.

Testing discipline and code review aren't an afterthought for me either. At **SheepCRM** I championed frontend reliability to **95%+ Jest coverage**, cutting post-deployment defects; at YGG I mentored a junior engineer whose test coverage went from near-zero to **~70%** under my review. On performance specifically, I led the frontend of **ARISE** at CODY, shipping two weeks early while lifting engagement **25%** and performance **30%** — the kind of concrete gain I'd want to bring to Tempo Timesheets and Capacity Planner.

One honest note: I don't have Java or Kotlin experience — my backend exposure has been Node/TypeScript rather than the JVM. Since the posting lists that as a plus rather than a requirement, and the role centers on the frontend, I don't expect it to be a blocker, but I'd rather say so directly than leave it unaddressed.

Thank you for reading this. I'd welcome the chance to talk through how I could contribute to Tempo's engineering team.

Kobe Michael.
